

DCSE V6.6 Video Production Governance

Status: FINAL - Packet-Ready

Authority: Subordinate Addendum to Master Profile v6.6.4

Classification: Internal Governance - Not Public-Facing

Purpose

This document is the V6 video-production addendum for governed creation of video content, motion graphics, audio assets, and multimedia deliverables across all DCSE entities.

It exists to control production quality, brand consistency, tool-chain discipline, asset management, secrets handling, distribution safety, and release readiness while remaining subordinate to Master Profile v6.6.4.

This addendum supplements V6. It does not take away from it. It also inherits and must comply with the Product Creation Governance addendum where video assets are embedded in or delivered alongside governed product builds.

Authority and Relationship to V6

Master Profile v6.6.4 remains the primary operational authority.

This addendum exists because video production has creative, technical, and distribution guardrails that should not over-expand the main master profile or the Product Creation Governance addendum.

Doctrine stack for video production tasks:

- Master Profile v6.6.4 (primary authority)
- v6.5 HTML Governance Doctrine (entity firewalls, model-duty registry, agentic controls)
- Product Creation Governance (when video is part of a product build)
- This Video Production Governance (current document)

Digital DNA operates as the identity, extraction, processing, calibration, and output-control layer for all video production governed by this addendum.

Scope

- Scripted and unscripted video content
- AI-generated video (Sora, Freepik, and equivalent tools)
- AI-generated images used as video assets (ChatGPT, Gemini, Claude)
- Voice-over and narration (ElevenLabs and equivalent)
- B-roll creation and curation
- Motion graphics and text overlays
- Music and audio design (royalty-free, AI-generated, or licensed)

- Video editing and post-production (PowerDirector and equivalent)
- Thumbnail and preview image creation
- Captions, subtitles, and accessibility compliance
- Asset library organization and governance
- Distribution across YouTube, website, LinkedIn, Instagram, and other platforms
- Secrets and API key management for production tools

Video Build Doctrine

Before production begins on any video asset, define:

- Target Entity: DCSE / SC / SS / PS / TI / DCS
- Content Series
- Video Type
- Target Platform(s)
- Audience
- Public/Internal Status
- Voice Archetype
- Assigned Model(s)
- Agentic Authorization Level
- Prohibited Expansion
- Digital DNA Compliance

No video production should proceed as an open-ended generation exercise. Every video is a governed product.

Entity-Specific Video Standards

Entity firewalls are absolute in video production. A video scoped to one entity must not bleed into another entity's voice, visual system, or narrative posture without explicit reauthorization.

- SC: Warm executive, strategic clarity, gold/ivory, minimal orchestral, no hype.
- SS: Soulful guide, amber/nature tones, soft jazz/ambient soul, no clinical coldness.
- PS: Precise, restrained, monochrome/document-grade, minimal audio, no entertainment framing.
- TI: Transparent, constitutional clarity, white/slate, clean neutral audio, distinct from PS.
- DCSE: Backbone, clinical structural authority, deep navy/silver, internal governance only.

GYTO Firewall in Video Production

GET YOUR THINK ON! (GYTO) must not appear in any public-facing video content - titles, thumbnails, on-screen text, captions, narration scripts, or metadata. GYTO is restricted to internal use only.

Any model generating a public-facing video script, storyboard, or asset must suppress GYTO automatically. If GYTO appears in a source prompt for a public video asset, the model must redact it and flag the occurrence.

Cinematic Production Standards

All DCSE video production aspires to cinema-grade quality within accessible tooling. The following are reference standards, not absolute requirements for every output. Scale to the video type and budget tier.

- Resolution: 4K DCI minimum for long-form; 1080p acceptable for social-first short-form; 8K as aspiration for flagship content.
- Frame Rate: 24 fps for cinematic delivery; 30 fps for web/social; 60 fps only where justified.
- Color: DCI-P3 preferred; HDR when supported; moody warm gradients as default grade.
- Camera Reference: ARRI Alexa 65 / RED Komodo anamorphic aesthetic as visual target.
- Voice-over: Professional-grade AI voice or live narration; third-person narrative only.
- Music: Minimal orchestral by default; entity-specific overrides permitted.

Reference standards in this section are target aspirations for cinema-grade quality. Actual outputs should scale to video type, budget tier, and platform requirements. Claims regarding resolution, frame rate, and color gamut are structural targets, not pre-verified guarantees unless explicit testing documentation is attached.

Production Pipeline

Every governed video follows this pipeline. Steps may be compressed for short-form content but not skipped.

- Pre-Production: declaration, script, storyboard, asset sourcing plan, voice-over script.
- Asset Creation: footage, B-roll, images, voice-over, music, motion graphics, thumbnails.
- Post-Production: assembly edit, audio mix, grade, text/graphics, captions, review cut.
- Export & Distribution: master export, platform exports, metadata packaging, scheduling.

Model-Duty Assignments for Video Production

- Script writing and narrative structure: Claude primary; human gate required.
- Storyboard and shot list: ChatGPT primary; Claude entity review.
- AI video prompts: ChatGPT primary; Gemini technical optimization.
- AI image prompts: ChatGPT primary; Claude/Gemini secondary.
- Voice-over script review and DNA calibration: Claude primary.
- Technical editing workflow: Gemini primary; human executes editor.
- Captions and subtitles: Gemini primary; Claude accuracy review.

- Metadata and descriptions: ChatGPT primary; Claude polish.
- PS legal education video content: Claude primary; human review mandatory.
- Distribution scheduling and orchestration: ChatGPT primary; human confirmation.

Tool-Chain Governance

- AI Video Generation: Sora primary, Freepik AI Video alternative.
- AI Image Generation: ChatGPT primary, Sora/Gemini/Claude alternatives.
- Voice-over: ElevenLabs primary.
- Video Editing: CyberLink PowerDirector primary, DaVinci Resolve alternative.
- Music / Audio: royalty-free libraries primary, AI-generated alternatives if licensed.
- Thumbnails / Graphics: Canva Pro primary, ChatGPT image generation alternative.
- Captions / Subtitles: PowerDirector built-in primary, YouTube auto-captions with review.

Asset Library Governance

Video assets must be stored, tagged, and retrievable. An ungoverned asset library is a liability.

- Master Archive: Google Drive - DCSE_Operations/Video_Assets/
- Folder Structure: entity > content series > asset type
- Naming Convention: [Entity]-[Series]-[AssetType]-[Version]-[Date]
- Local Working Files: local machine during active production; archive after completion

Minimum asset-tag fields should include entity, content series, asset type, source tool, license status, reuse status, version, id, brand, category, format, and reuse classification.

Secrets and API Key Management

Video production relies on external services requiring API keys, subscription credentials, and account access. These are governed infrastructure, not convenient strings.

- Never hardcode API keys into scripts, prompts, shared documents, or public repos.
- Store credentials in a secure password manager or, for Wix-integrated workflows, in Wix Secrets Manager with backend-only access.
- Document which tools require credentials and how they are consumed.
- Separate subscription credentials from production credentials.
- Review API key exposure risk during preflight.

Secret-bearing operations must be fully backend-mediated; zero client-side exposure. This rule is inherited from DCSE V6 Product Creation Governance Sections 12-13.

Content Series Framework

- SC Authority Series: SC, medium format, weekly, YouTube + LinkedIn.
- SS Transformation: SS, medium format, bi-weekly, YouTube + Instagram.
- PS Empowerment: PS, long-form, monthly, YouTube.
- Short-Form Vertical: SC / SS, short 9:16, 3x/week, Instagram Reels + YouTube Shorts.
- Executive Promos: DCSE / SC, promo 30-60s, as needed, website + YouTube + LinkedIn.

QA and Preflight

Every governed video must pass preflight checks before publication.

- Entity and Digital DNA compliance confirmed
- Voice archetype matches target entity
- GYTO absent from all public-facing surfaces
- Captions/subtitles present and accurate
- Audio levels balanced
- Color grade consistent with entity palette
- No AI-generation artifacts
- Thumbnail created and entity-consistent
- Music licensing verified
- No secret keys, credentials, or internal references visible in output
- Duration matches target format
- Platform-specific export requirements met

Release Rule

No video should be considered release-ready merely because it renders and plays.

- Preflight Declaration completed
- Entity firewall verified
- Digital DNA compliance confirmed
- GYTO firewall passed
- Licensing for all assets confirmed
- Human review completed for all Level 1 content
- Distribution metadata finalized
- Known limits documented where applicable

All public-facing video content is Agentic Level 1 - Supervised. No public video release without human review and approval. This aligns with the non-negotiable 'No public deployment at Agentic Level 3' from DCSE V6 Product Creation Governance.

Packet Guidance

When a governed video production task is requested, the ideal minimum packet is:

- Master Profile v6.6.4
- Model-specific V6 set
- This Video Production Governance addendum

Add the Product Creation Governance addendum only if the video is part of a larger product build such as an HTML module or Wix page.

Non-Negotiables

- No GYTO in public-facing video content
- No entity contamination across video productions
- No unlicensed music or assets in published content
- No AI-generated content published without artifact review
- No hardcoded secrets or API keys in scripts, prompts, or shared files
- No video published without preflight declaration
- No public release at Agentic Level 3
- No silent scope drift in content series
- No PS legal content treated as entertainment
- No weakening of V6 governance
