

While the Wix Classic Editor prioritizes **adaptability** over full responsiveness, there are several steps you can take to make your website look good across different screen sizes. It's important to understand that the Classic Editor uses **fixed breakpoints** for desktop, tablet, and mobile views, rather than fluidly adjusting across all screen sizes like a truly responsive design tool such as Wix Studio.

Here are the steps and considerations for using the Wix Classic Editor for website development with responsive design in mind:

## Designing for Adaptability in Wix Classic Editor (Desktop View)

The primary method for ensuring your site adapts well across different desktop screen widths in the Classic Editor is to **design within the vertical gridlines**. These two parallel dotted lines frame your website, and anything you want viewers to see on any screen size needs to be placed between them.

### 1. Place all crucial elements within the gridlines:

- **Zoom out** to see the gridlines clearly if you are working on a wide screen.
- **Drag and drop** your text, images, buttons, and other elements so they are positioned within these two lines. This ensures that content is visible and not cut off on narrower screens.
- Remember that non-responsive elements like text boxes and images should be kept within these vertical gridlines to appear correctly on most screen sizes.

### 2. Utilize "full-width" elements:

- Wix Editor offers specific elements that can expand to fill the entire screen width and adjust to the visitor's desktop screen size. These include:
  - **Sections and strips:** These organize and display content, spanning the full width of the browser and adjusting to screen size. You can **split strips into columns** to help spread out elements on wider screens and prevent overlapping on smaller ones.
  - **Full-width slideshows:** Choose a full-width layout in the Add Elements panel for responsiveness.
  - **Galleries:** The Wix Pro Gallery, Grid, and Slider galleries can behave responsively when set to full width and with certain layouts chosen.
  - **Horizontal menus and lines:** These can be stretched to full width to span the browser and adjust automatically.
  - **Wix app elements and Google Maps:** Many apps created by Wix, including Google Maps, are responsive when stretched to full-width.
- Look for the **Stretch icon** on elements, which indicates they can be stretched to full width and made responsive.

- Be aware that while full-width sections and strips adjust, **non-responsive elements** (like individual images, text, and shapes) *within* them will retain their fixed size, which may cause spacing variations across different screen sizes.
- 3. **(Advanced) Create multiple page designs for different resolutions:**
  - While not a true responsive solution, you can create separate page designs for different screen resolutions (e.g., small, medium, large).
  - You can then use the **Velo API** to detect the user's screen resolution and load the corresponding page design. This method requires more programming and design time.

## Optimizing the Mobile View

Wix **automatically generates a mobile-friendly version** of your site based on your desktop content, automatically resizing fonts, images, and elements for optimal viewing. Changes you make in the mobile editor **do not affect your desktop version**.

1. **Access the Mobile Editor:**
  - Click the **mobile icon** at the top of the editor to switch to the mobile view.
  - Select the "Edit Mobile View" radio button.
2. **Customize your mobile site's design and content:**
  - **Hide elements:** Wix automatically hides elements not optimized for mobile. You can manually **hide or unhide** additional elements as needed using the "Hidden Elements" icon.
  - **Re-order sections:** Use the "Zoom Out & Reorder" icon on the top bar of the mobile editor to drag and drop sections to change their order, or use the "Move Up" and "Move Down" icons.
  - **Adjust text size:** Although automatically optimized, you can manually scale text up or down for your mobile view.
  - **Change page background:** You can set a different background color, image, or video for your mobile page that won't affect the desktop background.
  - **Add mobile-only elements:** Incorporate elements like text, images, or buttons specifically for the mobile view. These won't appear on your desktop site and are marked with a specific icon in the mobile editor.
  - **Customize the mobile menu:** Fully customize the mobile menu icon, the menu box itself, and the menu items, including their design and how they open.
  - **Add mobile tools:** Utilize features like a welcome screen, Quick Action bar, or "Back to Top" button from the Mobile Tools panel to enhance mobile engagement and navigation.

## General Considerations for SEO and User Experience

- **Mobile-friendliness is a Google ranking factor.** While the Classic Editor relies on adaptive design, Wix ensures its pages generally meet Google's mobile-friendliness standards.
- Ensure **Name, Address, and Phone (NAP) consistency** across your website and other online listings like Google Business Profile. Inconsistencies can negatively impact your credibility and local search ranking.
- Adding **photos and videos** to your Google Business Profile (and by extension, your website) is crucial for engagement and can positively impact your ranking. Businesses with more photos tend to get significantly more calls, direction requests, and website clicks.
- Implement **structured data (schema markup)**, which helps search engines understand your content better and can improve your chances of appearing in special search results, including those for voice searches.
- Focus on **fast page load times**, which improve user experience and are an SEO ranking signal. In the Classic Editor, you can contribute to this by limiting media use, choosing minimalistic designs, and being selective with third-party apps. Wix also performs server-side rendering, utilizes CDNs, and automatically optimizes images and caches pages to improve performance.
- **Accessibility** is important, and optimizing your website's accessibility can also improve voice search rankings. This includes using alt text for images, clear anchor text for links, and captions/transcripts for media. Wix allows you to add alt text to images and offers an accessibility audit.

If you aim for a **truly responsive design** that adapts fluidly across all screen sizes with advanced design control, **Wix Studio** is recommended. However, be aware that migrating from the Classic Editor to Studio may require rebuilding your site from scratch and can be time-consuming, especially for transferring detailed data and content.
